json argument typing produces mypy warnings for valid dictionary payloads

Bug Report:

The json argument in requests.post produces mypy warnings for dictionaries that should be accepted as JSON-compatible payloads (Requests 2.34.1).

Reproduction Code:

```
import requests

def fn(d: dict[str, str]) -> None:
    j = {"foo": d, "bar": "hi"}
    requests.post("https://example.com", json=j)  # mypy error
```

```
# But inline works:
requests.post("https://example.com",
    json={"foo": d, "bar": "hi"})
```

Expected Behavior:

Valid JSON-compatible dictionaries should be accepted without mypy warnings.

Requirements:

1. Identify the overload/type definition causing the warning
2. Update typing to accept valid JSON dictionaries
3. Add type-checking tests
4. Ensure existing tests pass
