Multipart POST does not work correctly when Content-Type is defined on the session

Bug Report:

Multipart uploads break when a session has a pre-existing Content-Type header like application/json.

Reproduction Code:

```
import requests

session = requests.Session()
session.headers.update({"Content-Type": "application/json"})
files = {"file": ("example.txt", b"hello", "text/plain")}
response = session.post("https://example.com/upload",
    data={"name": "example"}, files=files)
```

Expected Behavior:

The final Content-Type should include the generated multipart boundary.

Requirements:

1. Reproduce the multipart POST behavior
2. Fix header merge order in request preparation
3. Ensure multipart boundary is preserved
4. Add tests for multipart with session Content-Type
5. Don't break existing JSON/session behavior
